   <h1><center>Biocomputing II - Group 6 Database</center></h1>
   An online database containing information for various genes found
      in Human Chromosome 1.
   This database allows you to search for specific genes based on multiple
       parameters including: Accession Number, Chromosomal Location and Protein
among others. The results page will return a table of information regarding the gene you have
searched for. For example, if you search 'RHD'
                                               in 'Gene ID' the results will show you
information only for genes with that Gene ID, as well as their accession numbers, protein
products etc.
   <b>Note</b> A table will also be returned for each specific entry,
highlighting respective codon usage in said entry, as well as across the entire database. Upon
clicking a specific entry, a more detailed breakdown
                                                       for the search can be seen, with
information such as restriction enzyme
                                                sites.
